

DM&E is the largest manufacturer of tow cutters and tension stands in the world, with installations on every continent. Tow cutter capacities range from the smallest laboratory cutter to 25 tons/hour. Crimped and uncrimped tow may be cut as short as 3mm or as long as 200mm. Fibers range from polyester and polypropylene to aramid and liquid crystal. Each installation can be custom configured to optimize investment and productivity.

Cutter reels and replacement parts for all cutters are shipped daily. The acquisition of the Lummus cutter product line continues the availability of Mk4 and Mk5 cutters and parts with DM&E quality.

We are the primary domestic source for tow crimper component repair and replacement parts. New components exceed original manufacturer specifications and worn parts can be returned to new condition. Our extensive process knowledge and engineering resources means quality goes beyond just replacing parts. DM&E's engineers are available for staple fiber process analysis and seminars, spinning through baling.
